Leading Causes of Death by Age, Sex, Race, and Hispanic Origin: United States, 1992

by Paula Gardner, MPH, and Harry M. Rosenberg, Ph.D.,
Division of Vital Statistics, and Ronald W. Wilson, Office of
Analysis, Epidemiology, and Health Promotion

Introduction

In recent years data users have requested leading cause-of-death data in more detailed age and race and ethnic categories than is usually available in National Center for Health Statistics (NCHS) publications. This report presents 1992 data on leading causes of death by race, sex, and Hispanic origin using three age aggregations. The report includes detailed tables illustrating the effect the different age aggregations have on the ranking of individual causes and discusses issues concerning the use of alternative age aggregations. The report also describes the cause-of-death ranking procedure used by NCHS, other agencies of the Public Health Service, and many State public health agencies.

NCHS has been publishing leading cause-of-death data since 1960 when tabulations ranking causes of death for the white and nonwhite populations and the male and female

populations of the United States were introduced. In 1977 broad age categories were added to tabulations for these groups, and in 1989 NCHS began showing age, race, and sex in the same table. Although alternative groupings of the population according to race, ethnic origin, or any of a number of other demographic variables will also affect the identification and ranking of particular causes, the focus of this report is on the effect of different age aggregations.

NCHS publishes leading cause-of-death data annually in several publications including *Vital Statistics of the United States, Mortality, Volume II, Part A*; *The Advance Report of Final Mortality Statistics, Monthly Vital Statistics Report (MVSR)*; *Annual Summary of Births, Marriages, Divorces, and Deaths (MVSR)*; and *Health United States*. Rankings are typically presented for the 10 or 15 leading causes of death (table A). Leading cause-of-death data also appear frequently in publications of many State and Federal public health agencies.

Table A. Deaths and death rates for the 10 leading causes of death: United States, 1992

[Rates per 100,000 population. For explanation of asterisk preceding cause-of-death codes, see [Technical notes](#)]

Rank ¹	Cause of death, race, sex, and age (Ninth Revision International Classification of Diseases, 1975)	Number	Rate
...	All causes	2,175,613	852.9
1	Diseases of heart 390-398,402,404-429	717,706	281.4
2	Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues 140-208	520,578	204.1
3	Cerebrovascular diseases 430-438	143,769	56.4
4	Chronic obstructive pulmonary diseases and allied conditions 490-496	91,938	36.0
5	Accidents and adverse effects E800-E949	86,777	34.0
...	Motor vehicle accidents E810-E825	40,982	16.1
...	All other accidents and adverse effects E800-E807,E826-E949	45,795	18.0
6	Pneumonia and influenza 480-487	75,719	29.7
7	Diabetes mellitus 250	50,067	19.6
8	Human immunodeficiency virus infection *042-*044	33,566	13.2
9	Suicide E950-E959	30,484	12.0
10	Homicide and legal intervention E960-E978	25,488	10.0
...	All other causes Residual	399,521	156.6

¹Rank based on number of deaths.

NOTES: This report was prepared in the Division of Vital Statistics. Donna Hoyert Ph.D., Mortality Statistics Branch, peer-reviewed this report, and Betty Smith of the Statistical Resources Branch provided content review. Staff of the Registration Methods Branch and the Technical Services Branch provided consultation with State vital statistics offices regarding collection of the death certificate data on which this report is based. This report was edited by Gail V. Johnson of the Publications Branch, Division of Data Services.

Ranking procedures

In the 1950's, a working group made up of State and Federal representatives recommended that, to improve comparability, the various reporting agencies identifying diseases of public health importance adopt a uniform ranking procedure. This group developed the standardized procedures for ranking leading causes of death now in use by NCHS (1).

Causes are ranked according to the number of deaths (not rates) assigned to the 37 rankable causes from the List of 72 Selected Causes of Death (table B), together with the category HIV infection (Human immunodeficiency virus infection, ICD-9 Nos. *042-*044). HIV infection was introduced by NCHS in 1987 data tabulations and added to the list of rankable causes (2,3). Categories on the List of 72 Selected Causes of Death excluded from ranking include the group titles Major cardiovascular diseases; Symptoms, signs, and ill-defined conditions; and category titles that begin with the words "Other" and "All other." When a title representing a subtotal is ranked (such as Tuberculosis), its component parts are not ranked (Tuberculosis of the respiratory system and Other tuberculosis) (4).

NCHS introduced a separate ranking procedure for infant causes based on the number of deaths assigned to the List of 61 Selected Causes of Infant Death beginning with the 1980 data year. HIV infection was also added to this list beginning with 1987 data (3). NCHS publishes leading causes of neonatal and post-neonatal deaths annually. Because the data are readily available, data for infants are not presented in this report.

Mortality tabulation lists used by NCHS can be found in the *NCHS Instruction Manual, Part 9* and subsequently published notices of change (4,5). Descriptions of the tabulation lists can also be found in the Technical Appendix of *Vital Statistics of the United States, Volume II, Mortality* (3).

Effects of age aggregation on ranking

The rank a cause of death receives varies according to the number of variables and the level of detail used to classify the population of interest. As with sex, race, and ethnic classifications, the age aggregation used influences both the identification of causes of death as public health problems and the relative importance of these causes once identified. For example, Chronic obstructive pulmonary disease (COPD) is not among the 10 leading causes of death for the 45–49-year-old age group but is the fifth leading cause of death for the 45–64-year-old group and the ninth leading cause of death for the

45–54-year-old group. Although each of these statements is true, each results in a different understanding of the relative importance of COPD as a public health problem. These differences can have important program implications.

The three age aggregations most widely used in NCHS presentations of general mortality data are aggregations in 5-year age groups starting with ages 5–9 and continuing through ages 80–84, with a final group 85 years and over; aggregations in 10-year age groups starting with ages 5–14 continuing through ages 75–84, with a final group 85 years and over; and aggregations in broad age groupings (1–4 years, 5–14 years, 15–24 years, 25–44 years, 45–64 years, and 65 years and over). These age categories reflect both convention and international requirements. NCHS currently uses the broadest age categories. The mortality statistics presented in this report were compiled in accordance with the World Health Organization (WHO) regulations, which specify that member nations classify causes of death by the current *Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death* (6).

Effects of alternative age aggregations

Tables C and D illustrate the effect of different age aggregations on the rankings of heart disease (Diseases of heart, ICD Nos. 390–398,402,404–429) and HIV infection (Nos. *042-*044).

Heart disease was the leading cause of death for U.S. residents (all ages) in 1992. It was among the leading 10 causes in all age groups regardless of the age aggregation used. Its importance as a leading cause increases with increasing age. Using 5-year age aggregations, heart disease was the fifth or sixth leading cause of death beginning with the age group 1–4 years through the age group 25–29 years—when its relative importance begins to increase. It is the second leading cause by ages 40–44 years and remains at that rank through ages 65–69 years, when it becomes the leading cause of death.

Although variations in rank occur among the three age aggregations, the rankings in the broadest age grouping reflect the pattern in the more detailed 5- and 10-year age groupings. However, in the broad age grouping, the change in rank at middle age lags behind that of the more detailed groupings. Heart disease increases in importance beginning at ages 35–39 years as shown in the 5-year age groups rather than at ages 45–64 as shown in the broad age grouping. Heart disease assumes its relative importance as the leading cause at age 65

Table B. List of 72 selected causes of death: United States, 1992

Number	Cause of death (Ninth Revision International Classification of Diseases, 1975)	Number	Cause of death (Ninth Revision International Classification of Diseases, 1975)
	All causes	38	Intracerebral and other intracranial hemorrhage 431-432
1*	Shigellosis and amebiasis 004-006	39	Cerebral thrombosis and unspecified occlusion of cerebral arteries 434.0,434.9
2	Certain other intestinal infections 007-009	40	Cerebral embolism 434.1
*	Tuberculosis 010-018	41	All other and late effects of cerebrovascular diseases 430,433,435-438
3	Tuberculosis of respiratory system 010-012	42*	Atherosclerosis 440
4	Other tuberculosis 013-018	43	Other diseases of arteries, arterioles, and capillaries 441-448
5*	Whooping cough 033	44*	Acute bronchitis and bronchiolitis 466
6*	Streptococcal sore throat, scarlatina, and erysipelas 034-035	*	Pneumonia and influenza 480-487
7*	Meningococcal infection 036	45	Pneumonia 480-486
8*	Septicemia 038	46	Influenza 487
9*	Acute poliomyelitis 045	*	Chronic obstructive pulmonary diseases and allied conditions 490-496
10*	Measles 055	47	Bronchitis, chronic and unspecified 490-491
11*	Viral hepatitis 070	48	Emphysema 492
12*	Syphilis 090-097	49	Asthma 493
13	All other infectious and parasitic diseases 001-003,005,020-032,039-041,046-054,056-066,071-088,098-139	50	Other chronic obstructive pulmonary diseases and allied conditions 494-496
*	Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues 140-208	51*	Ulcer of stomach and duodenum 531-533
14	Malignant neoplasms of lip, oral cavity, and pharynx 140-149	52*	Appendicitis 540-543
15	Malignant neoplasms of digestive organs and peritoneum 150-159	53*	Hernia of abdominal cavity and intestinal obstruction without mention of hernia 550-553,560-571
16	Malignant neoplasms of respiratory and intrathoracic organs 160-165	54*	Chronic liver disease and cirrhosis 571
17	Malignant neoplasm of breast 174-175	55*	Cholelithiasis and other disorders of gallbladder 574-575
18	Malignant neoplasms of genital organs 179-187	*	Nephritis, nephrotic syndrome, and nephrosis 580-589
19	Malignant neoplasms of urinary organs 188-189	56	Acute glomerulonephritis and nephrotic syndrome 580-581
20	Malignant neoplasms of all other and unspecified sites 170-173,190-199	57	Chronic glomerulonephritis, nephritis and nephropathy, not specified as acute or chronic, and renal sclerosis, unspecified 582-583,587
21	Leukemia 204-208	58	Renal failure, disorders resulting from impaired renal function and small kidney of unknown cause 584-586,588-589
22	Other malignant neoplasms of lymphatic and hematopoietic tissues 200-203	59*	Infections of kidney 590
23*	Benign neoplasms, carcinoma in situ, and neoplasms of uncertain behavior and of unspecified nature 210-239	60*	Hyperplasia of prostate 600
24*	Diabetes mellitus 250	*	Complications of pregnancy, childbirth, and the puerperium 630-676
25*	Nutritional deficiencies 260-269	61	Pregnancy with abortive outcome 630-638
26*	Anemias 280-285	62	Other complications of pregnancy, childbirth, and the puerperium 640-676
27*	Meningitis 320-322	63*	Congenital anomalies 740-759
*	Major cardiovascular diseases 390-448	*	Certain conditions originating in the perinatal period 760-779
28	Diseases of heart 390-398,402,404-429	64	Birth trauma, intrauterine hypoxia, birth asphyxia, and respiratory distress syndrome 767-769
29	Rheumatic fever and rheumatic heart disease 390-398	65	Other conditions originating in the perinatal period 760-766,770-779
30	Hypertensive heart disease 402	66	Symptoms, signs, and ill-defined conditions 780-799
31	Hypertensive heart and renal disease 404	67	All other diseases Residual
32	Ischemic heart disease 410-414	*	Accidents and adverse effects E800-E949
33	Acute myocardial infarction 410	68	Motor vehicle accidents E810-E825
34	Other acute and subacute forms of ischemic heart disease 411	69	All other accidents and adverse effects E800-E807,E826-E949
35	Angina pectoris 413	70*	Suicide E950-E959
36	All other forms of chronic ischemic heart disease 412,414	71*	Homicide and legal intervention E960-E978
37*	Other diseases of endocardium 424	72	All other external causes E980-E999
38	All other forms of heart disease 415-423,425-429		
39*	Hypertension with or without renal disease 401,403		
*	Cerebrovascular diseases 430-438		

NOTE: The causes designated by the asterisk can be ranked to determine leading causes of death for specified population groups.

using the broadest age aggregation, at age 75 using the 10-year age aggregation, and at age 70 using the 5-year age aggregation.

In contrast to heart disease, the level of age detail used has a greater effect on the ranking of HIV infection. There are more differences and larger discrepancies in rank among the three age aggregations. HIV infection was the eighth leading cause of death in 1992 but the leading cause for 35-39-year-old age group using the 5-year age aggregation. HIV infection was never ranked first using the 10-year and the broad age aggregations but did rank second for 25-34 and 35-44-year-old age groups and for the 25-44-year-old age group using the 10-year and broad age aggregations. The ranking of eighth for the broad age group 45-64 years seriously understates the importance of HIV infection for the 45-49-year-old and 50-54-year-old age groups. At these ages, it ranked fourth and sixth, respectively. Although greater discrepancies in rank

occurred among the different age aggregations for HIV infection than for heart disease, the 10-year and broad aggregations do reflect the ages at which HIV infection is an important cause of death.

Differences in the relative importance of the leading causes of death among different race, ethnic, and sex groups are apparent for all ages combined. Heart disease and cancer (Malignant neoplasms) are the first and second leading causes of death for the total population. Stroke (Cerebrovascular diseases), accidents, pneumonia and influenza, and diabetes are among the 10 leading causes for each group, although the ranking differs from group to group. COPD, HIV infection, and suicide are among the 10 leading causes of death for some but not all groups. Chronic liver disease and cirrhosis is not among the leading causes for the total population but is among the 10 leading causes for the Hispanic and white populations.

Table C. Ranking of Diseases of heart by alternative age groupings: United States, 1992

Age	5-year age group	10-year age group	Broad age groups
All ages	1	1	1
1–4 years	5	5	5
5–9 years	5 }
10–14 years	6 } . . .	6	6

50–54 years	2 } . . .	2 } . . .	2
55–59 years	2 } . . .	2 }
60–64 years	2 }
65–69 years	2 } . . .	2 }
70–74 years	1 }	1
75–79 years	1 } . . .	1 }
80–84 years	1 }
85 years and over	1	1	. . .

Certain conditions originating in the perinatal period and the puerperium is on the leading cause lists only for the Hispanic and black populations. Nephritis, nephrotic syndrome, and nephrosis; septicemia; and atherosclerosis appear among the 10 leading causes only for the female population.

Differences in the relative importance of the leading causes of death among different race, ethnic, and sex groups become more apparent when more detailed age aggregations are used. Tables E–O illustrate the effect increasingly detailed age classifications have on the rankings of the 10 leading causes of death for the U.S. population. Cancer is the third leading cause of death for 25–44-year-olds; the fourth leading cause for males but the leading cause for females; the second leading cause for the white population, the fifth leading cause for the black population, and the fourth leading cause for the

Table D. Ranking of Human immunodeficiency virus infection by alternative age groupings: United States, 1992

Age	5-year age group	10-year age group	Broad age groups
All ages	8	8	8
1–4 years	7	7	7
5–9 years	6 } . . .	7	7
10–14 years }
15–19 years	10 }
20–24 years	6 } . . .	6	6

55–59 years	10 }
60–64 years
65–69 years
70–74 years
75–79 years
80–84 years
85 years and over

Hispanic population; and it is the fifth leading cause for white and black males and the sixth leading cause for Hispanic males 25–44 years of age.

Increased age detail provides a more accurate picture of critical age differences among these groups for different causes of death: heart disease first becomes the leading cause of death for white males 40–44 years of age and for black and Hispanic males 45–49 years of age; but it does not become the leading cause of death for black females until 65–69 years of age, for Hispanic females until 70–74 years of age, or for white females until 75–79 years of age. Compare this with the broad age groups in which heart disease becomes the leading cause for white males at 45–64 years of age and for white females at 65 years and over.

Table E. Effect of different age aggregations on ranking of Diseases of heart by race, Hispanic origin, and sex: United States, 1992

[Rankings are based on deaths assigned to category numbers 390–398, 302, 404–429 of the Ninth Revision of the International Classification of Diseases, 1975]

Age	All races			White			Black			Hispanic origin

Discussion

The level of age detail used to tabulate data affects the identification and rankings of causes of death. For many purposes, the use of broad age groupings is adequate. If a particular cause is disproportionately important to a specific age/race/sex group, the identification of that cause as a public health problem may require the use of more specific aggregations. There is not a “best” age aggregation. The degree of

detail needed for an accurate picture depends on the cause examined, the purpose of the study, and the population group of interest. The degree of age detail shown in NCHS mortality tabulations is determined by convention, requirements for standardization, and the number of other classification variables shown in the tabulations.

Technical notes

Nature and sources of data

Data in this report are based on information from all death certificates filed in the 50 States and the District of Columbia. Mortality statistics are based on information coded by the States and provided to NCHS through the Vital Statistics Cooperative Program (VSCP) and from copies of the original certificates received by NCHS from the State registration offices. In 1992 all the States and the District of Columbia participated in this program and submitted part or all of the mortality data for 1992 on computer tape to NCHS. Data for the entire United States refer to events occurring within the United States. Beginning with 1970 mortality statistics exclude deaths of nonresidents of the United States.

Race

For vital statistics in the United States in 1992, deaths are classified by race—white, black, American Indian, Chinese, Hawaiian, Japanese, Filipino, Asian and Pacific Islander, Asian Indian, Korean, Samoan, Vietnamese, Guamanian, and Other. The white category includes, in addition to persons reported as white, those reported as Mexican, Puerto Rican, Cuban, and all other Caucasians. The American Indian category includes American, Alaskan, Canadian, Eskimo, and Aleut. If the racial entry on the death certificate indicates a mixture of Hawaiian and any other race, the entry is coded to Hawaiian. If a mixture of races other than white is given (except Hawaiian), the entry is coded to the first race listed. This procedure for coding the first race listed has been used since 1969. Before 1969, if the entry for race was a mixture of black and any other race except Hawaiian, the entry was coded to black.

Race not stated

For 1992, the number of death records for which race was unknown, not stated, or not classifiable was 5,776 or 0.3 percent of the total deaths. Beginning in 1992 all records coded as “Other races” (0.01 percent of all deaths) were assigned to the specified nonwhite race of the previous record. Records for which race was unknown, not stated, or not classifiable (0.26 percent of all deaths) were assigned the racial designation of the previous record. Before 1964, all records with race not stated were assigned to white except records of residents of New Jersey for 1962–64. Adjustments made in vital statistics to account for the omission of the race item in New Jersey for part of the certificates filed during 1962–64 are described in the technical appendixes of *Vital Statistics of the United States* for each of those data years.

Quality of race data

A number of studies have been conducted on the reliability of race reported on the death certificate by comparing race on the death certificate with that reported on another data collection instrument, such as the census or a survey. Differences may arise because of differences in who provides race information on the compared records. Race information on the death certificate is reported by the funeral director as provided by an informant or in the absence of an informant, on the basis of observation. In contrast, race on the census or on the Current Population Survey is self-reported, and therefore, may be considered more valid. A high level of agreement between the death certificate and the census or survey report is essential to assure unbiased death rates by race.

Hispanic origin

For 1992 mortality data for the Hispanic-origin population are based on deaths to residents of 48 States and the District of Columbia whose data were approximately 80 percent or more complete on a place-of-occurrence basis and considered to be sufficiently comparable to be used for analysis. Data include all States except New Hampshire and Oklahoma, which were excluded because their death certificates did not include an item to identify Hispanic or ethnic origin.

In 1990 the 48 States and the District of Columbia accounted for 99.6 percent of the Hispanic population in the United States, including about 99.5 percent of the Mexican population, 99.7 percent of the Puerto Rican population, 99.8 percent of the Cuban population, and 99.6 percent of the “Other Hispanic” population (7).

Cause-of-death classification

The mortality statistics presented here were compiled in accordance with the World Health Organization (WHO) regulations, which specify that member nations classify causes of death by the current *Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death* (6). Causes of death for 1979–92 were classified according to the manual.

In addition to specifying the classification, WHO regulations outline the form of medical certification and the procedures to be used in coding cause of death. Cause-of-death data presented in this publication were coded by procedures outlined in issues of the *NCHS Instruction Manual* (8–10).

In this report tabulations of cause-of-death statistics are based solely on the underlying cause of death. The underlying cause is defined by WHO as the disease or injury that initiated the sequence of events leading directly to death or as the circumstances of the accident or violence that produced the fatal injury. It is selected from the conditions entered by the physician in the cause-of-death section of the death certificate. When more than one cause or condition is entered by the physician, the underlying cause is determined by the sequence of conditions on the certificate, provisions of the ICD, and associated selection rules. Generally, more medical information is reported on death certificates than is directly reflected in the underlying cause of death.

Codes for HIV infection

Beginning with data for 1987, NCHS introduced category numbers *042–*044 for classifying and coding Human immunodeficiency virus (HIV) infection. The asterisk before the category numbers indicates that these codes are not part of the *Ninth Revision of the International Classification of Diseases (ICD–9)*. They are included, but not shown separately, in the category “All other infectious and parasitic diseases” in the List of 72 Selected Causes of Death and in the category “Remainder of infectious and parasitic diseases” in the List of 61 Selected Causes of Infant Deaths. Before 1987 deaths involving HIV infection were classified to “Deficiency of cell-mediated immunity” (ICD–9 No. 279.1), contained in the category “All other diseases”; to “Pneumocystosis” (ICD–9 No. 136.3), contained in the category “All other infectious and parasitic diseases”; to “Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissue”; and to a number of other causes. As a consequence, cause-of-death data beginning with 1987 are not strictly comparable with data for previous years.

Population bases for computing rates

The population used for computing death rates in this report (furnished by the U.S. Bureau of the Census) represents the population residing in the specified area. Death rates for 1992 are based on population estimates as of July 1, 1992 (11,12). The estimates are based on the 1990 census counts. The 1990 census counts by race were modified to be consis-

tent with U.S. Office of Management and Budget categories and historical categories for death data (13). No adjustment for Census undercounts of the Hispanic population is made in the estimates used as denominators for rates.

Random variation

Although the mortality data in this report are not subject to sampling error, they may be affected by random variation in the number of deaths involved. When the number of events is small (perhaps less than 100) and the probability of such an event is small, considerable caution must be observed in interpreting the data. Such infrequent events may be assumed to follow a Poisson probability distribution. For this distribution, a simple approximation may be used to estimate the confidence interval, as follows:

If N is the number of registered deaths in the population and R is the corresponding rate, the chances are 19 in 20 (approximate 95-percent confidence interval) that

$$1. N - 2\sqrt{N} \text{ and } N + 2\sqrt{N}$$

covers the “true” number of events.

$$2. R - 2\frac{R}{\sqrt{N}} \text{ and } R + 2\frac{R}{\sqrt{N}}$$

covers the “true” rate.

If the rate R_1 corresponding to N_1 events is compared with the rate R_2 corresponding to N_2 events, the difference between the two rates may be regarded as statistically significant if it exceeds

$$3. 2\sqrt{\frac{R_1^2}{N_1} + \frac{R_2^2}{N_2}}$$

Additional information on random variation may be found in the *Technical Appendix of Vital Statistics of the United States, 1987* (3).

Rates, proportions, and ratios

Beginning with 1989 data, an asterisk is shown in place of a rate based on fewer than 20 deaths. These rates have a relative standard error of 23 percent or more and are considered statistically unreliable.

Vital and Health Statistics series descriptions

- SERIES 1. **Programs and Collection Procedures**—These reports describe the data collection programs of the National Center for Health Statistics. They include descriptions of the methods used to collect and process the data, definitions, and other material necessary for understanding the data.
- SERIES 2. **Data Evaluation and Methods Research**—These reports are studies of new statistical methods and include analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory. These studies also include experimental tests of new survey methods and comparisons of U.S. methodology with those of other countries.
- SERIES 3. **Analytical and Epidemiological Studies**—These reports present analytical or interpretive studies based on vital and health statistics. These reports carry the analyses further than the expository types of reports in the other series.
- SERIES 4. **Documents and Committee Reports**—These are final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.
- SERIES 5. **International Vital and Health Statistics Reports**—These reports are analytical or descriptive reports that compare U.S. vital and health statistics with those of other countries or present other international data of relevance to the health statistics system of the United States.
- SERIES 6. **Cognition and Survey Measurement**—These reports are from the National Laboratory for Collaborative Research in Cognition and Survey Measurement. They use methods of cognitive science to design, evaluate, and test survey instruments.
- SERIES 10. **Data From the National Health Interview Survey**—These reports contain statistics on illness; unintentional injuries; disability; use of hospital, medical, and other health services; and a wide range of special current health topics covering many aspects of health behaviors, health status, and health care utilization. They are based on data collected in a continuing national household interview survey.
- SERIES 11. **Data From the National Health Examination Survey, the National Health and Nutrition Examination Surveys, and the Hispanic Health and Nutrition Examination Survey**—Data from direct examination, testing, and measurement on representative samples of the civilian noninstitutionalized population provide the basis for (1) medically defined total prevalence of specific diseases or conditions in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics, and (2) analyses of trends and relationships among various measurements and between survey periods.
- SERIES 12. **Data From the Institutionalized Population Surveys**—Discontinued in 1975. Reports from these surveys are included in Series 13.
- SERIES 13. **Data From the National Health Care Survey**—These reports contain statistics on health resources and the public's use of health care resources including ambulatory, hospital, and long-term care services based on data collected directly from health care providers and provider records.
- SERIES 14. **Data on Health Resources: Manpower and Facilities**—Discontinued in 1990. Reports on the numbers, geographic distribution, and characteristics of health resources are now included in Series 13.
- SERIES 15. **Data From Special Surveys**—These reports contain statistics on health and health-related topics collected in special surveys that are not part of the continuing data systems of the National Center for Health Statistics.
- SERIES 16. **Compilations of Advance Data From Vital and Health Statistics**—Advance Data Reports provide early release of information from the National Center for Health Statistics' health and demographic surveys. They are compiled in the order in which they are published. Some of these releases may be followed by detailed reports in Series 10–13.
- SERIES 20. **Data on Mortality**—These reports contain statistics on mortality that are not included in regular, annual, or monthly reports. Special analyses by cause of death, age, other demographic variables, and geographic and trend analyses are included.
- SERIES 21. **Data on Natality, Marriage, and Divorce**—These reports contain statistics on natality, marriage, and divorce that are not included in regular, annual, or monthly reports. Special analyses by health and demographic variables and geographic and trend analyses are included.
- SERIES 22. **Data From the National Mortality and Natality Surveys**—Discontinued in 1975. Reports from these sample surveys, based on vital records, are now published in Series 20 or 21.
- SERIES 23. **Data From the National Survey of Family Growth**—These reports contain statistics on factors that affect birth rates, including contraception, infertility, cohabitation, marriage, divorce, and remarriage; adoption; use of medical care for family planning and infertility; and related maternal and infant health topics. These statistics are based on national surveys of childbearing age.
- SERIES 24. **Compilations of Data on Natality, Mortality, Marriage, Divorce, and Induced Terminations of Pregnancy**—These include advance reports of births, deaths, marriages, and divorces based on final data from the National Vital Statistics System that were published as supplements to the *Monthly Vital Statistics Report (MVSR)*. These reports provide highlights and summaries of detailed data subsequently published in *Vital Statistics of the United States*. Other supplements to the MVSR published here provide selected findings based on final data from the National Vital Statistics System and may be followed by detailed reports in Series 20 or 21.
